

## Problem Sheet No.2

1-

A 2-kW resistance heater wire with thermal conductivity of  $k = 20 \text{ W/m} \cdot ^\circ\text{C}$ , a diameter of  $D = 5 \text{ mm}$ , and a length of  $L = 0.7 \text{ m}$  is used to boil water. If the outer surface temperature of the resistance wire is  $T_s = 110^\circ\text{C}$ , determine the temperature at the center of the wire.

2-

Consider a large plane wall of thickness  $L = 0.3 \text{ m}$ , thermal conductivity  $k = 2.5 \text{ W/m} \cdot ^\circ\text{C}$ , and surface area  $A = 12 \text{ m}^2$ . The left side of the wall at  $x = 0$  is subjected to a net heat flux of  $\dot{q}_0 = 700 \text{ W/m}^2$  while the temperature at that surface is measured to be  $T_1 = 80^\circ\text{C}$ . Assuming constant thermal conductivity and no heat generation in the wall, (a) express the differential equation and the boundary conditions for steady one-dimensional heat conduction through the wall, (b) obtain a relation for the variation of temperature in the wall by solving the differential equation, and (c) evaluate the temperature of the right surface of the wall at  $x = L$ . *Answer: (c)  $-4^\circ\text{C}$*

3-

Consider a large 3-cm-thick stainless steel plate ( $k = 15.1 \text{ W/m} \cdot ^\circ\text{C}$ ) in which heat is generated uniformly at a rate of  $5 \times 10^5 \text{ W/m}^3$ . Both sides of the plate are exposed to an environment at  $30^\circ\text{C}$  with a heat transfer coefficient of  $60 \text{ W/m}^2 \cdot ^\circ\text{C}$ . Explain where in the plate the highest and the lowest temperatures will occur, and determine their values.

4-

Consider a homogeneous spherical piece of radioactive material of radius  $r_0 = 0.04 \text{ m}$  that is generating heat at a constant rate of  $\dot{g} = 4 \times 10^7 \text{ W/m}^3$ . The heat generated is dissipated to the environment steadily. The outer surface of the sphere is maintained at a uniform temperature of  $80^\circ\text{C}$  and the thermal conductivity of the sphere is  $k = 15 \text{ W/m} \cdot ^\circ\text{C}$ . Assuming steady one-dimensional heat transfer, (a) express the differential equation and the boundary conditions for heat conduction through the sphere, (b) obtain a relation for the variation of temperature in the sphere by solving the differential equation, and (c) determine the temperature at the center of the sphere.

5-

A long homogeneous resistance wire of radius  $r_0 = 5 \text{ mm}$  is being used to heat the air in a room by the passage of electric current. Heat is generated in the wire uniformly at a rate of  $\dot{g} = 5 \times 10^7 \text{ W/m}^3$  as a result of resistance heating. If the temperature of the outer surface of the wire remains at  $180^\circ\text{C}$ , determine the temperature at  $r = 2 \text{ mm}$  after steady operation conditions are reached. Take the thermal conductivity of the wire to be  $k = 8 \text{ W/m} \cdot ^\circ\text{C}$ . *Answer:  $212.8^\circ\text{C}$*
